riley.mycopsi.dev

Senior Software Engineer with 11+ years of experience owning full-stack features from end-to-end. Java and Spring Boot are the core of my production background. Complemented by active experience across Python, Ruby on Rails, React, and TypeScript through personal projects and ongoing migration work. I have a track record of translating complex requirements into clean, maintainable, and reliable technical solutions. I am drawn to fast-moving teams where engineering quality directly shapes the product.

Technical Skills

Frontend: React, TypeScript, JavaScript, Next.js, Node.js, ZK Framework (Java UI)

Backend & APIs: Java 8+, Python, Spring Boot, Spring Core/Web, RESTful API Design, Microservices Architecture, Job Orchestration, Jackson Framework, JUnit

Data & Databases: PostgreSQL, Oracle SQL, Snowflake, Yellowbrick, Data Pipeline Design, Schema Modeling

DevOps & Observability: Docker, AWS, CI/CD Pipelines, Production Log Analysis, System Monitoring, GIT/SVN

Practices: Agile/Scrum, SDLC, Unit Testing, Code Review, Technical Documentation, Object-Oriented Programming

Experience

Senior Software Engineer

Circana (formerly NCSolutions) | Tampa, FL/Full-Remote | Feb 2019 - Present

- Designed and implemented a high-volume bulk report feature from end-to-end. A single bulk submission expands into multiple child jobs via a parent-child model. Leveraged existing job prioritization to protect interactive workloads from being starved by large batch runs, and graceful partial-failure handling to prevent isolated errors from collapsing entire runs.
- Designed and implemented scalable backend services and RESTful APIs using Java and Spring Boot.
- Supported high-volume production data engines across a service-oriented, microservices architecture.
- Architected reusable Spring Boot backend archetypes to provide a standardized and quick set up of boilerplate engine code.
- Executed Java 8 to Java 17 migration across multiple services. Improving runtime performance, security posture, and long-term maintainability of production systems.
- Engineered a consolidated service that replaced multiple client run processes, reducing client operational workload by approximately 10 times.
- Contributing to a platform migration post company acquisition from Java and Spring Boot to Python, PySpark, and Hadoop. Modernizing data processing infrastructure and refactoring legacy business logic into scalable, maintainable services.
- Analyzed production logs to troubleshoot production issues in a timely manner.
- Served as a rotating Release Coordinator. Overseeing deployment process and post-release monitoring ensuring reliable, low-risk production releases.

- Collaborated with cross-functional stakeholders to gather requirements and deliver full-stack features serving operational and integration use cases, owning delivery end-to-end.

Software Developer

Recondo Technology | Denver, Co | November 2015 - July 2018

- Developed automated batch bots using Java 8 and Selenium WebDriver to extract patient claim and authorization data from health insurance web portals, improving data collection efficiency.
- Collaborated with business analysts to refine technical requirements, increasing both the accuracy and efficiency of WebBot and Batch Bot operations.
- Resolved client-reported defects with a low defect rate by thoroughly investigating issues, engineering targeted solutions, and validating fixes prior to QA handoff.
- Performed DevOps responsibilities including deploying software artifacts to shared team servers, ensuring consistent and reliable release processes

Projects

Personal Portfolio Website | React, TypeScript, Tailwind, Framer Motion

- Designed and built a fully custom personal portfolio with a skill badge system that dynamically highlights based on scroll position, card hover state.
- Used Intersection Observer for section detection and Framer Motion for animations
- Integrated GitHubAPI via Octokit to pull project data into portfolio
- Built a contact form with EmailJS, hCaptcha bot protection, client-side validation, and input sanitization.

Psinaptic | FastAPI, SQL Alchemy, Next.js, PostgreSQL, Docker, TypeScript

- Currently designing and building a productivity and collaboration tool leveraging Kanban boards and sprint trackers.
- Documented architectural decisions, user stories, and iterative improvement cycles.
- Backend services are built leveraging Python, FastAPI, and SQL Alchemy, Pydantic, Alembic, and Tanstack Query.
- Frontend services will be built leveraging Next.js and Typescript.
- Datastore utilizes PostgreSQL
- Containerized with Docker Compose.

Vibecast | Ruby on Rails, React, TypeScript, PostgreSQL, Anthropic API

- Built a full-stack web application that transforms a user's mood or moment into a personalized music recommendation.
- Leverages the Anthropic Claude API to generate curated artists, tracks, and genres with AI-generated context for each match.
- Designed a Ruby on Rails API backend with a React and TypeScript frontend, PostgreSQL as the data store, and RSpec and WebMock for test coverage.

Python Task App | FastAPI, Next.js, PostgreSQL, Docker

- A simple full-stack CRUD task management app — the foundation and learning ground for Psinaptic.

Education

Metropolitan State University of Denver, Denver, CO

B.A in Computer Science and Mathematics

Awards & Recognition

Growth Award

- Stepped up to own UI development responsibilities during a period of team attrition, facilitating delivery with no disruption to project timelines.
- Consistently took on high-complexity projects under tight deadlines, delivering quality outcomes through strong technical execution and initiative.

Inclusion Award

- Engineered a consolidated reporting solution that replaced multiple redundant client-run services with a single unified report. Reduced client operational workload by approximately 10 times.

Courage Award

- Took ownership of software release coordination responsibilities. Overseeing deployment procedures, deploying core artifacts. With post-release monitoring to ensure reliable, low-risk production releases.

Trust & Accountability Award

- Delivered a Client Delivery report solution that enabled stakeholders to track client delivery and associated revenue. Improved visibility and accountability across client-facing teams.
